Where Might Xdebug Fit Into your Workflow?

- **Not for frontend*:**
  Browser 'dev tools' (Chrome, Firefox) are perfect for frontend debugging CSS & Javascript
  * (You can send variable data to the console but your not able to step through the code realtime)

- **Xdebug is not for TDD:**
  Tools like *PHPUnit*, *Codeception* and *Selenium* might reduce the need for Xdebug but they're not meant for realtime stack tracing.

- **Xdebug is good for investigating what the code is currently doing, line by line, step by step**
  Examples:
  - Taking over a legacy project
  - Digging into a chronic problem

Xdebug Couples with your web server and your IDE
